Accuracy & efficiency

Overview

Specialized working in Computer vision and LLMs.

1. Worked with clients from Retail, Manufacturing, Logistics sector.
2. Especially worked on edge computing and deployed almost 20+ usecases for all the projects in edge devices.
3. Deployed and managed approximately 1300+ edge devices across all the projects.
4. Got Good Business to the company and able to impress the clients with the work and was able to expand the POCs to projects.

The Retail and Logistics Sector Projects

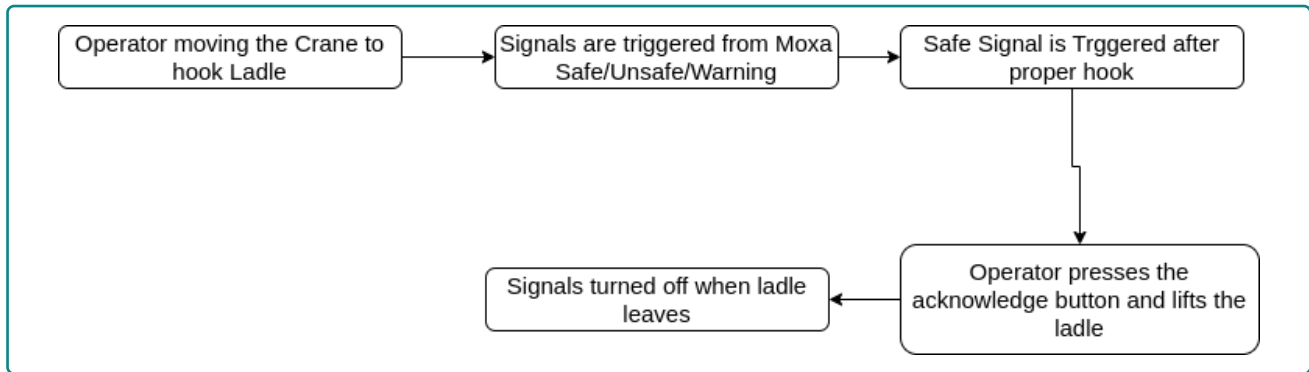

1. Worked with 6 clients in the retail sector.
2. Deployed the devices to almost 1200 locations and managing them from a central application server.
3. Developed 20+ computer vision and LLM use cases.
4. Constantly following up with the client for the Business requirements and providing them with insights through dashboard and email reports potentially increasing their retail and logistics productivity.

The Manufacturing Sector Projects

Safe Ladle Hooking Project (Arcelor Mittal)

1. It is a large Scale Industrial Safety Project. The solution would detect if it is safe to lift the ladle of molten steel with the crane hook.
2. It would detect if the crane hook is properly hooked to the ladle ensuring the operator that it is safe to move the ladle the from the ladle station.

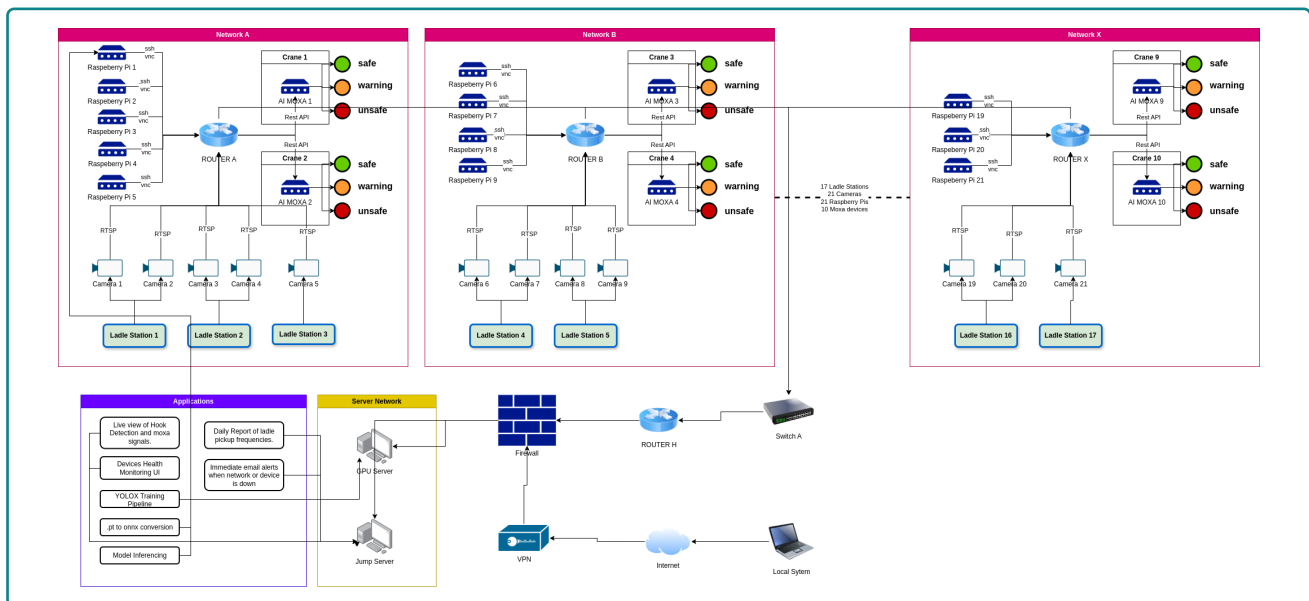

The project Flow.

3. The projects involves the following components.

- 17 ladle stations
- 21 cameras
- 21 Raspberry Pis
- 10 moxa devices

4. The following is the network architecture on how the components are connected.

5. The solution reached to an efficiency of 98% and an accuracy of 100%.

Result: 98% efficiency | 100% accuracy across all ladle stations

Research and Development Projects (Maruti Suzuki and Oerlikon)

1. The projects are Research based.
2. They are deployed across 4 locations.
3. The client is given the UI to use the solution deployed in the devices.
4. It is a completely standalone setup , no server communication is involved.
